

Interactive Mobile Manipulators for Advanced Industrial Diagnostics

Florian Weisshardt

florian.weisshardt@ipa.fraunhofer.de

Fraunhofer IPA
Stuttgart, Germany

Application case

Facts:

- Products for the consumer market need extensive testing
- 0,1% of the production is currently tested in the life cycle test laboratory
- Machines work for many cycles in order to simulate their working life (250-500 cycles)

Application case

Situation today:

- Operators are responsible to switch washing machines on and off and to load them with laundry
- Some quantities are measured for each machine automatically (energy absorption, water consumption, number of cycles)
- Additional parameters like machines vibration and noise are checked by the operators manually
- Installing additional measurement sensor on each machine to check these parameters automatically would be too expensive

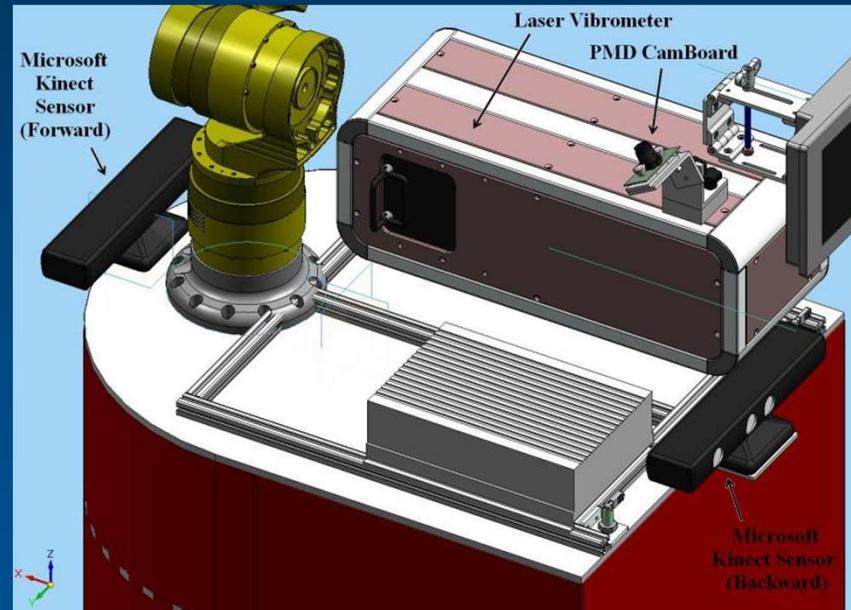

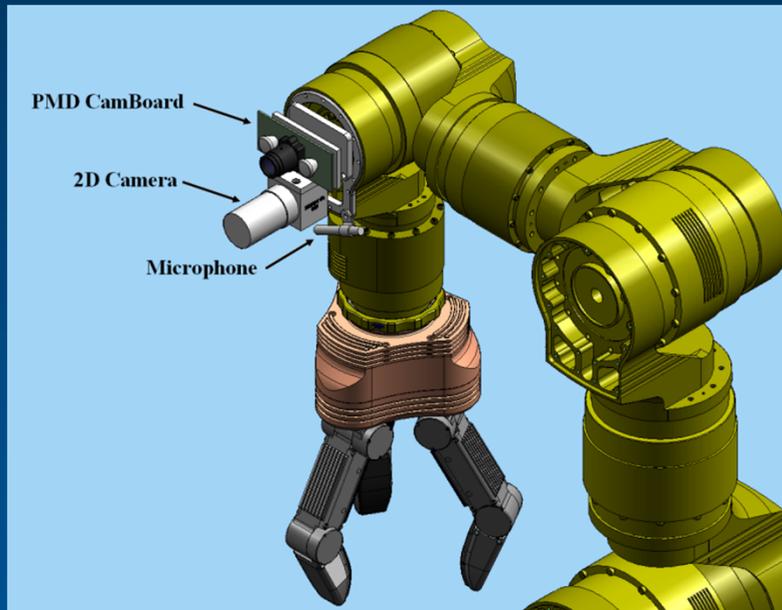

Experiment goals

Automation using a Mobile Diagnostics Robot:

- automatically executes checks and operations on the washing machines
- this allows to relieve the operators from these repetitive tasks
- acquire additional quality data (e.g. noise, vibrations) with sensors on the robot

Advanced mobile manipulator

- Mobile base with manipulator
- 2D and 3D cameras, laser vibrometer, microphone

Advanced mobile manipulator

- Prototype integration

First results

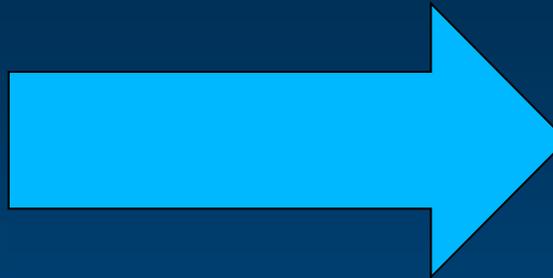

- Successful tests in laboratory on a single washing machine

- To be continued with real world field test...

Technology Transfer: Hardware Integration

Fraunhofer robots

InterAID prototype

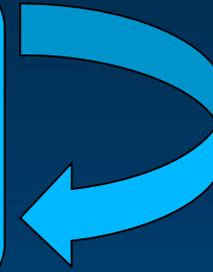

- Selecting and placing manipulator regarding workspace
- Integrating sensors regarding field of view and type

Technology Transfer: Software

Open Source Software
(framework, libraries, technologies)

Fraunhofer Software
(libraries, technologies)

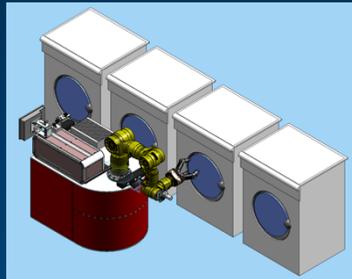

- Adapting
- Extending
- Optimizing
- Enhancing

Transfer of

- Hardware drivers
- Manipulation
- Navigation
- Environment perception
